CAG: Main Geophysical Observatory (Glavnaya geofizicheskaya observatoriya)

TITLE: Influence of limitation of the indicatrix measurement interval on the accuracy  
of the small-angle method

SOURCE: AN SSSR. Izvestiya. Fizika atmosfery i okeana, v. 2, no. 8, 1966, 851-858

TOPIC TAGS: light dispersion, light scattering, atmospheric cloud, fog, particle dis-

ABSTRACT: This is a continuation of earlier work (Tr. GGO, no. 152, 1964 and preceding papers) dealing with the determination of the particle spectrum of a disperse system, such as a natural cloud or fog, from data on its light scattering, and is devoted to the accuracy with which the spectrum can be reconstructed by means of inversion of the scattering pattern by the small-angle method. The authors first analyze the direct problem of determining the optical information necessary to describe scattering from a system of particles with a  $\gamma$  distribution. A formula is derived which makes it possible to estimate the contributions of the small and large particles to the total distribution of the light. A series of numerical calculations with this formula shows that when the small-droplet fraction is eliminated from the spectrum, the entire scattering pattern contracts to the ordinate axis, and when the large-droplet fraction is disregarded, the pattern becomes distorted, and the pattern acquires an oscillatory

Card 1/2

UDC: 551.521.3: 535.361

L 10249-67  
ACC NR: AP6030084

character. The inverse problem is then considered and it is shown theoretically that if the optical measurements include a certain fundamental angle interval, then the spectrum can be reconstructed with a sufficient degree of accuracy. This angle interval depends on the requirements imposed on the particle-size distribution function and on the specified particle-size interval. Orig. art. has: 4 figures and 22 formulas.

SOV/115-59-2-35/38

TITLE:

On Training State Inspectors (O podgotovke gosudarstvennykh poveriteley)

PERIODICAL:

Izmeritel'naya tekhnika, 1959, <sup>20</sup>, Nr 2, pp 59-60  
(USSR)

ABSTRACT:

The author stresses the great importance of training personnel for measuring technique control laboratories, especially for laboratories Class 3. These personnel must be fully capable of checking all kinds of measuring equipment for mechanical, electro-thermal-technical and linear-angular measurements. If the inspectors are over-specialized and can only check one type of measurement, then 2 or 3 additional controllers must be sent to check the same apparatus, and this is difficult for the Class 3 laboratories with their small staffs. Formerly, aspiring state inspectors were trained in special courses, which gave them an extensive background in applied metrology as well as the theoretical aspects of measur-

Card 1/2

On Training State Inspectors

SOV/115-59-2-35/38

ing techniques, so valuable for laboratories Class 3. Nowadays, the State Control Laboratories admit candidates to the inspectorate who have graduated from a technical college. Unfortunately, there is no single, coordinated plan of study and standards of proficiency vary considerably. The author suggests the special courses be revived so that laboratories Class 3 could train their workers with a technical education. These would eventually replace those officials who do not have the requisite qualifications. The new courses, setting generally recognized standards, would deal with every possible aspect of metrology. The author requests reader reaction to these suggestions.

TITLE:

On the resolving power of the magneto-telluric method

PERIODICAL:

Akademiya nauk SSSR. Izvestiya. Seriya geofizicheskaya,  
no. 11, 1960, 1598-1600

TEXT: The authors investigate theoretical possibilities of using the magneto-telluric method, based on geomagnetic pulsations, when studying geological profiles consisting of three layers of thickness  $h_1$ ,  $h_2$ ,  $h_3 = \infty$  and resistivity  $\rho_1 < \rho_2$ ,  $\rho_3 = \infty$ . The authors develop a formula for calculating apparent-resistivity curves

$$\frac{\rho_T}{\rho_1} = \frac{1 + 2e^{-\beta} (A \cos \beta - B \sin \beta) + (A^2 + B^2) e^{-2\beta}}{1 - 2e^{-\beta} (A \cos \beta - B \sin \beta) + (A^2 + B^2) e^{-2\beta}} \quad (6) \quad \times$$

and give some examples of graphs by different parameters (Fig. 2, Fig. 3).  
 $\mu = P_2/P_1 = 2.0; 4.0$  and  $v = h_2/h_1 = 1.0; 2.0; 3.0; 5.0; 9.0$ . Every

curve  $P_T$  corresponds to the ratio  $\lg P_T / P_1 \sim \lg \sqrt{T}$  where  $T$  -- period of oscillation by constant parameters  $\mu$  and  $v$  of the geological cross section. A comparison with the curves obtained by vertical electrical sounding is given in Fig. 3. Interpretation of the field data matches the experimental curve (apparent-resistivity vs period) with a standardized theoretical curve of the same nature. The displacement of the 0 point of the standard curve from the abscissa corresponds to the resistivity of the first layer and from the ordinate with the value  $h_1/\sqrt{P_1}$ . After calculating the longitudinal conductivity  $S_1$  of the first layer, the conductivity of the second layer can be computed according to the formula  $S_2 = S_1 \cdot v / \mu$  where  $\mu$  and  $v$  -- moduli of theoretical curve. Depth of the third layer can be computed according to the formula

TITLE: A method for registering the horizontal magnetic component of short-period variations of the earth's electromagnetic field

SOURCE: USSR. Glavnaya upravleniya geologii i okhrany nedr. Geofizicheskaya razvedka, no. 9, 1962, 51-58

TEXT: The interference produced in measurements of the horizontal component of the short-period variation of the earth's electromagnetic field by the actual level of microseismic activity and by the constant geomagnetic field is eliminated by mounting the transducer so that its long axis is tilted in the direction of the total vector of the constant geomagnetic field. Variations with nonvanishing vertical component are suppressed by employing the horizontal loop. The method makes possible the application of high-sensitivity transducers. There are 2 figures. ✓

Mrs.: N.A. Volkov, and Z.G. Matveev. Ed. Tech. Ed.: L.V. Smilova; Managing Ed. Eng.  
Literature on Machine-building Technology (Machine); Ye.P. Kuzov, Engineer.

PURPOSE: This collection of articles is intended for engineering and technical  
personnel in machine-building establishments, and for scientific workers and  
students of institutes and departments of engineering and economics.

COVERAGE: This collection of articles contains reports by workers from various  
scientific research institutes, and industrial establishments presented at the  
conference of USSR on the subjects: "Organization and Planning of Uniform  
Operations in Machine-building Establishments." These reports discuss general  
problems encountered in organization, analysis, and theory of uniform production,  
as well as problems in schedule planning, technical preparation, and production  
specialization.

SOV/117-59-2-10/27

TITLE:

Machining of Parts with the Scheduling of production (K voprosu uvyazki metodov gruppovoy obrabotki detalej i kalendarного planirovaniya proizvodstva)

PERIODICAL:

Mashinostroitel', 1959, Nr 2, pp 18-19 (USSR)

ABSTRACT:

This article points to some ways to eliminate shortcomings incident to the introduction of the group production method, such as flaws in the planning and insufficient work loads of the machines. In one shop of an unidentified plant of polygraphic machines, which machined about 1,500 various parts, there were 18 various adjustments of the capstan lathes. A high degree of work load (94-100%) was obtained with only three adjustments. Twelve adjustments provided a work load of from 7 to 47%, three adjust-

SOV/117-59-2-10/27

To the Question of Coordinating Methods of Group Machining Works  
With the Calender Planning of Production

ments from 52 to 74%. A low work load of lathes almost nullified the advantages of the group production method. The authors recommend the unification of some similar adjustments, and stresses the necessity of working out new systems of adjustments. They suggest allotting several group adjustments to the lathe, better coordination of planning work with processes. There is 1 table.

AUTHORS: Kolmakov, V. A. and Abrossov, A. I.

TITLE: The design of instruments for the measurement of sound pressure

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 4, 1962, abstract 4-5-30zh (V sb. Primeneniye ul'traakust. k issled. veshchestva, no. 14, M., 1961, 129-138)

TEXT: The AZ-2(AZ-2) and AZ-3 instruments have been designed for the measurement of sound pressure in gases and liquids, as well as for determining the frequency and observing the waveform of pressure. The pressure is measured by means of thin-walled spheres of barium titanate 5.10 and 15 mm in diameter. In the AZ-2 instrument the signal from a sphere is applied to an amplifier, to the output of which standard measuring instruments are connected. The AZ-3 comprises, in addition to an amplifier, an electronic voltmeter, a frequency-meter and an oscilloscope. Ther spherical receivers were

TITLE: Radar Observations of Meteors at the Stalinabad Astronomical Ob-  
servatory During June - December 1957

PERIODICAL: Byul. In-ta astrofiz. AN TadzhSSR, 1958, No. 24, pp. 15-21

TEXT: In correspondence with the IGY program, radar determinations of meteor numbers were conducted at Stalinabad from June 1, 1957. Instrument parameters are as follows: frequency, 72.98 Mc/sec; receiver sensitivity,  $0.6 \times 10^{-12} W$ . Antenna of the "radiating guide" type, consists of an oscillator, a reflector and seven directors. It is mounted at a height of 11 m above the ground, its beam slope is  $22^\circ$  to the horizon. Its directivity coefficient is 24. The width of directivity diagram in horizontal plane is  $\pm 23^\circ$ . In the vertical plane 3 lobes are used with radiation maxima at the angles to the horizon being  $22^\circ$ ,  $31^\circ 15'$  and

EXCERPTA MEDICA Sec.12 Vol.11/9 Ophthalmology Sept 57

1473. KOLMAKOVA A. \*The evaluation of glaucomatous disease by dynamic changes of the blind spot (Russian text) VESTN. OFTAL. 1956, 6 (26-26)

The study of the dynamic changes of the borders of the blind spot - the responsive reaction of the perineural zone of the retina to various stimulators - is a valuable aid in the judgment of the progress of the disease and the function of the eye. The blind spot was examined in the morning hours with an object of 5/5 mm. at 16 points. The examination was done under various conditions with and without pressure by Baillart's ophthalmodynamometer, by giving bromides or caffeine to the patient before the examination, by injecting novocaine along the superficial temporal artery, by causing positive or negative emotions in the investigated patients. The blind spot was examined before and after using these measures. 31 patients were investigated, of these, 14 had glaucoma, 2 were glaucoma suspects, 2 had secondary glaucoma and 13 patients had various other eye diseases. Some patients who received bromides showed no stability. It remained enlarged. Some patients in whom emotional upsets were caused, showed narrowing of the size of the blind spot but other emotionally unstable patients showed enlargement of the spot. The author stresses the point that conditioned reflex reactions play a big role in the changes of the size of the blind spot, i.e., there is a close relationship between the functions of the retina and the condition of the cortex of the brain. The general condition of the patient, his adaptability to various distressing conditions in his life, may also change the size of the blind spot.

**TITLE:** Studies in the field of synthesis and conversions of vinylaryl  
esters. No. 17. Synthesis and certain properties of  $\alpha,\beta$ -di-  
bromethylaryl esters. No. 16. The addition of mercaptans to  
vinyl esters of the aromatic series

**PUBLICATION:** Referativnyy zhurnal. Khimiya, no. 4, 1961, 238, abstract  
4Zh122 (Izv. Fiz.-khim. n.-ta pri Irkutskom un-te, v. 5,  
no. 1, 1961, 193 - 206, 225 - 237)

**TEXT:** (17) Bromination of the vinyl esters of phenol (I), o-cresol (II),  
m-cresol (III) and thymol (IV) in  $\text{CCl}_4$  gave the respective  $\alpha,\beta$ -dibromo-  
ethyl esters (V - VII), which have lachrymatory properties; without the  
solvent partial polymerization takes place. IV - VII probably exist in the  
form of two tautomeric forms  $\text{CH}_2\text{BrCHBrOAr} \rightleftharpoons [\text{CHBr}=\text{CHO(H)Ar}]^+\text{Br}^-$ ,  
as ionic Br is easily back-titrated by aqueous solutions of NaOH and  $\text{AgNO}_3$ ,

S/081/63/000/004/017/051  
B166/B186

Studies in the field of...

whilst IV - VII themselves are smoothly converted into  $\beta$ -bromvinyl esters (BVE) when vacuum distilled, yield 80 - 85%. Hydrolysis of IV - VII proceeds in two distinct stages: first of all under the action of  $H_2O$  cold there is

hydrolysis of the weak oxonium complex, and the BVE which forms only splits again in an acid medium. Let us take the case of IV, for example.

1.5 - 2 hrs, 0.15 moles dry  $Br_2$  in 20 ml  $CCl_4$ , and IV,  $C_6H_9OBBr_2$ , was distilled b.p. 100°/12 mm Hg, yield 97.2%, o.p. 129 - 150°C/12 mm Hg,  $n^{20}_{D}$  1.4849,  $d^{20}_{4}$  1.7418, fumes

of  $Br_2$  and 50 ml water were shaken in a separatory funnel at 0° - 5°C for 1 hr, neutralized with alkali, and the aqueous layer collected,  $n^{20}_{D}$  1.3900, b.p. 100 - 150°C/12 mm Hg,  $d^{20}_{4}$  1.0210, fumes of  $Br_2$ .

For 6 - 7 hrs; this was neutralized with alkali and extracted with ether; after separation,  $BrCH_2CHO$  was separated from the residue in the form of a

yellowish liquid, b.p. 100 - 150°C/12 mm Hg,  $n^{20}_{D}$  1.4849,  $d^{20}_{4}$  1.7418, fumes of  $Br_2$ .

etc., are given: the substance, yield %, b.p. in °C/mm Hg,  $n^{20}_D$ ,  $d_4^{20}$ );  
I, 96.1, 124.14, 1.5718, 1.5504, 1.5662; VI, 96.1, 126 - 127.3, 1.5450, 1.4900; VII, 97.5, 149 - 150.4,  
 $n^{20}_D$  1.5548, 1.4595.

(18) The addition of ethyl- and butylmercaptans to I - III was achieved by  
radical mechanisms, leading to  $\text{CH}_2\text{CH}(\text{SR})\text{OAr}$  (IX) and  $\text{RSCH}_2\text{CH}_2\text{OAr}$   
(X). Substitutes of the first type, however, considerably simplify radical addition. The thioacetals produced are easily  
hydrolyzed with dilute  $\text{H}_2\text{SO}_4$  and split quantitatively when X is treated  
with  $\text{H}_2\text{O}_2$ , which proves their structure to be that of  $\beta$  adducts; under these  
conditions IX is highly stable. 0.1 mole I, 0.1 mole  $\text{I}_2\text{H}_2\text{S}^+$  and 0.02 g azo-  
diisobutyronitrile were heated in a sealed ampoule at 90 - 100°C for  
14 hrs, and X ( $\text{R} = \text{C}_2\text{H}_5$ ; Ar =  $\text{C}_6\text{H}_5$ ),  $\text{C}_{10}\text{H}_{14}\text{OS}$ , was distilled, yield 85.02%,  
b.p. 123.5°C/3 mm Hg,  $n^{20}_D$  1.5433,  $d_4^{20}$  1.0543. The other X were produced  
under similar conditions (below are given: R, Ar, the gross formula, yield %,

mp. ca. 20°C/mm Hg,  $n^{20}_D$ ,  $d_4^{20}$ ;  $C_4H_9$ ,  $C_6H_5$ ,  $C_{12}H_{18}OS$ , 97.20, 141.0 - 142.0/2,  
mp. 100°C,  $C_6H_5$ ,  $\alpha$ -CE<sub>2</sub>C<sub>6</sub>H<sub>4</sub> (IXa),  $C_{10}H_{14}OS$ , 101.0 - 102.0/2,  $d_4^{20}$  1.0436,  
 $d_4^{25}$  1.0436.

Procedure. A weak stream of dry  $SO_2$  was bubbled for 1 - 2 min into a 250 ml ampoule containing 0.1 mole I and 0.1 mole  $C_6H_5SH$ ; this was allowed to stand at 3 - 4 hrs and then neutralized with dry  $H_2O_2$ , giving IX  
(Ar =  $C_6H_5$ ) (IXa),  $C_{10}H_{14}OS$ , yield 68.5%, b.p. 62 - 63.0°C/3 mm Hg,  
 $n^{20}_D$ ,  $d_4^{20}$  1.0436. A mixture of 0.2487 g IIa and an excess of 20%  
 $CH_3Cl_2$  in alcohol was allowed to stand 24 hr; 0.25 g m-methyl  
benzyl 47.2% HCl was added, followed by 0.1 g NaH.  
After 1 hr, the reaction mixture was neutralized with 10% NaOH.

The benzyl derivative was isolated, washed with water, dried over  $CaH_2$ ,  
yield 0.242 g, mp. 100°C,  $n^{20}_D$ ,  $d_4^{20}$  1.0436. This was dissolved in  
ether and added dropwise to a solution of 0.1 g  $NaBH_4$  in ether. After  
neutralization with 10% NaOH, the ether was removed under reduced pressure.

TITLE: A device for the construction of perspective points in their corresponding space coordinates

SOURCE: IVUZ. Priborostroyeniye, v. 9, no. 3, 1966, 137-140

TOPIC TAGS: projective geometry, coordinate system, engineering instrument

ABSTRACT: A device designed to construct perspective (three-dimensional) objects in space coordinates from a two-dimensional surface representation is described. By means of logarithmic functions and use of this instrument, it is possible to convert complex relations between the space and surface coordinates into simple arithmetic form. The main parts of the instrument are a slide rule and a movable cylinder, the scale of which indicates a dependence of logarithmic functions. A perspective drawing of an IL-12 airplane constructed with the aid of the instrument is demonstrated. The instrument can be used as a basic or partial aid in architectural representation of an object. The device was developed by the author in cooperation with Engineer V. P. Solodnikov. Orig. art. has: 5 figures.

ABSTRACT: Several kinds of equipment used are described. 1) Automatic device for the drilling of rivets of 3 mm in diameter, 5 - 11 mm long, to a drilling depth of 3 mm with a drill of 1.8 mm in diameter and a capacity of 1,200 rivets/hour. The automatic device consists of the bed, headstock, index head, distributing shaft, pump with tank, and electromotor. 2) Hydraulic device for the reduction of electromachine bodies along their inner diameter, made of steel bands, operating with an oil pressure of 170 - 180 at. 3) Mechanism for the automatic feed of copper bands to the press for the punching of commutator plates, which consist of the feeding mechanism, the straightening device and
